

Secure Resilient Networks

Two Factor Authentication

Simplify remote user authentication to your IT infrastructure while providing added security

CI-Net provides a VASCO security device in the form of a token referred to as a Digipass, which provides strong user authentication and e-Signatures. This device is compatible with more than 50 international vendors for e-Commerce, e-Banking, e-Networking and e-Government applications.

The DIGIPASS Pack is a security software solution that provides "two factor strong authentication" for any radius environment and is certified for many VASCO ready solution partners. This two factor solution requires authorized users to demonstrate the possession of both the DIGIPASS device, by typing the One-Time Password generated, and the knowledge of their unique user ID.

However, one important security breach that allows network hackers easy access to corporate information is known as "user authentication". The randomly generated pass-key is used to identify the specific person in order for them to gain access. Home-workers, travellers and Internet users will all rely on VPN and firewall technology to enter corporate networks gaining access to sensitive resources. The VASCO token provides this secure authentication to enable access to these secure environments.

Flexibility

The Vasco device is compatible with more than 50 international vendors for e-Commerce, e-Banking, e-Networking and e-Government applications. The DIGIPASS Pack provides "two factor strong authentication" for any radius environment and is certified for many VASCO Ready Solution Partners. VASCO Tokens can be provided as a Java Applet for other devices such as mobile phones.

Value for Money

VASCO tokens are very competitively priced, and have a much longer life span than many rival tokens giving them a low total cost of ownership. They can also help to reduce the administrative costs associated with re-supplying lost or forgotten passwords.
