

Secure Resilient Networks

RedKite

A new way to secure your Internet connection

Protecting your business

Have you ever considered what would happen to your business if communications with the outside world via email and the Internet were disrupted? What would be the cost of lost orders and lost productivity if you were in the dark for an hour, two hours, a day, or even a week?

For many the impact is immediate, and by the time the connection has been down for two hours the effect could be critical. Whilst longer than a two day disruption is rare it has happened, always with severe damage to business reputation, not to mention bottom line costs.

Wired & Wireless resilience

You may already have built in some diversity within your Wide Area Network via dual network providers. But all too often these run on the same physical routers, firewalls, fibres and exchanges. All of which become a single point of failure risk.

RedKite offers you a truly resilient solution by giving you the option to have connectivity to two different access points on your premises from two different exchanges via two different access technologies: one via a traditional fibre connection, the other via a high-speed wireless link.

Balancing the load

The RedKite Wired & Wireless strategy makes use of all the bandwidth available to provide optimum performance and make the most of your investment. The solution includes automated line balancing and fail-over in the event that either of the connections fail.

An additional advantage of this approach is that you ensure both lines are fully working. Many companies we have worked with have a 'spare' line as back-up in case their primary service fails. However, all too often technical problems are found with the back-up just when it is most needed.

Our approach is to use Wired & Wireless connectivity for everyday communications, with automatic fail-over in the event that either service is disrupted, and automatic load balance once both services are available again.

Price performance

RedKite offers exceptional value for money and can be delivered within 10 working days. You can start with a small amount of bandwidth and simply turn the bandwidth up as demand grows without further set up costs and time delays.

Please contact us for further information

If you are planning additional band-width, the cost of RedKite can be absorbed in existing budgets by using RedKite to upgrade your total bandwidth instead of upgrading an existing wired service.

RedKite the facts:

RedKite is a high speed, wireless Internet access service, based on pre-WiMax technology. Available at speeds from 1 to 100Mb, RedKite represents a scalable, flexible solution for your connectivity requirements.

- 1 to 100Mb dedicated connection with 1:1 contention ratio.
- Symmetrical bandwidth - same upload/download speeds.
- 99.9% availability backed by a comprehensive SLA.
- Dedicated Technical Support Team and 24 hour network monitoring.
- Installation within 10 days.
- Conforms to IEEE standards.

Availability

RedKite is currently available in central London, Birmingham, Oxford, Hemel Hempstead and various business parks. In addition we are rolling the service out to other cities, town centres and additional business parks around the UK based on demand.
